

英 問

英 語

令 和 4 年 度 (前期日程)

注 意

1. 「解答はじめ」というまで開いてはいけない。
2. 問題は1冊(本文13ページ)、解答用紙は4枚である。
3. 全部の解答用紙に受験番号を書くこと。受験番号は次の要領で明確に記入すること。

(例) 受験番号 50001 番の場合 →

5	0	0	0	1
---	---	---	---	---

4. 解答は解答用紙の所定の位置に書くこと。他の所に書くと無効になることがある。解答用紙の裏面は使ってはならない。字数などの指示がある場合は、その指示に従って書くこと。解答文は横書きとする。
5. 書き損じても、代わりの用紙は交付しない。
6. 試験終了後、問題冊子は持ち帰ること。

I 次の英文を読み、下の問いに答えなさい。（*を付した語句には、問題文の末尾に注がある。）

Picture two cartoon characters, one round and the other spiky. Which would you name Boubba, and which one Kiki? And which do you then think is more outgoing? Perhaps surprisingly, most of you will probably attribute the same name and characteristics to each of the shapes. A growing body of research suggests that people tend to make a range of judgments based on nothing (A) the sound of a word or name.

At its most basic, this is known as the *bouba-kiki* effect, or *maluma-takete* effect, because of how our minds link certain sounds and shapes. Across many different languages, people tend to associate the sounds “b”, “m”, “l”, and “o” (as in the made-up words *bouba* and *maluma*) with round shapes.⁽¹⁾ The sounds “k”, “t”, “p”, and “i”, as in the nonsense words *kiki* and *takete*, are commonly seen as spiky. These associations may be partly rooted in the physical experience of saying and hearing sounds, with some feeling more effortful and rough than others.

Surprisingly, the *bouba-kiki* effect even extends into human relationships, and how we imagine the personalities of people we’ve never met. Cognitive psychologist* David Sidhu at University College London and psycholinguist* Penny Pexman at the University of Calgary have found that people perceive certain personal names such as Bob and Molly as round, and others such as Kirk and Kate as spiky. In French, they showed the same effect with the “round” Benoit versus the “spiky” Eric. In a separate study, participants pictured people with those names as having rounded or spiky personalities. “The basic thing we find is that if you compare these very smooth, soft-sounding names, like Molly, to these harsher-sounding names like Kate, that the smoother-sounding names like Molly get associated with things like being more agreeable, more emotional, more responsible, whereas the harsher, spikier-sounding names are thought of as

being more extroverted*,” says Sidhu.

These widespread associations may (B) in how these sounds feel in our mouth, according to Sidhu. “If you think about pronouncing an ‘m’ versus a ‘t’, for example, that ‘m’-sound feels much smoother, and that symbolically captures the smoothness of the rounded shape versus the spiky shape.” Sounds like “t” and “k” may feel more energetic, capturing an extroverted, cheerful, lively quality.

And this mouth-feel of the words we use can influence how we experience the world. (C) any given moment we use a series of subtle cues to pull together information from all our senses, and make judgments and predictions about our environment. “There’s something about how humans are ⁽²⁾ fundamentally associative,” Pexman says. “We want to see patterns in things, we want to find connections between things, and we’ll find them even between sounds, and the things those sounds stand for in the world.”

Such associations can help us with important real-life tasks, such as language-learning and guessing the meaning of (D) words. In English, words for round things are often round-sounding, as in blob, balloon, ball, marble. Words like prickly, spiny, sting, and perky are spiky both in sound and meaning. Sounds can also indicate size. An “i”-sound is linked to smallness, while an “o”-sound indicates largeness. Some of these links exist across thousands of languages, with the “i”-sound excessively popping up in words for “small” around the world.

For people learning new words, whether babies, young children, or adults, these patterns can be very helpful. Young children and even babies already match round sounds with round shapes. Parents tend to use sound-shape associations to emphasise the meaning of certain words, such as “teeny tiny.” Adults benefit (E) associations when they learn a new language, finding it easier to guess or remember foreign words when their sound matches their meaning.

Some argue that these instinctive connections between sounds and meaning may even be a leftover from humanity's earliest stages of language evolution, and that human language itself started as a string of such expressive, readily guessable sounds.

When it comes to people's personalities, however, sound is not a reliable guide at all. Sidhu, Pexman, and their collaborators tested whether there was a link between a person's name and their personality, perhaps because the round or spiky sound of the name became attached to the wearer. They found no such association. "People worry about baby names. It's this expectation that the label matters so much," Pexman says. "Our data would suggest that although that's what we think, if you call the kid Bob, they're not any more likely to end up with one set of personality characteristics than another."⁽³⁾

Instead, our reaction to a name probably reveals more about our own prejudices. "It does suggest that we're prepared to read a lot into somebody's name that probably isn't a cue to what that person is actually like," says Pexman.

Results from an ongoing study by Sidhu, Pexman, and collaborators suggest that the sound of a name has less (F) an impact as we find out more about people. When participants were shown videos of people with supposedly round or spiky names, the names made no difference to their judgment of them. "When all you know is the name, like in these studies when you're just shown a name and asked about the personality, then maybe these sounds will play a role," Sidhu says. "But as you start getting more information about the person, then that actual information about the personality is probably going to cancel these biases."⁽⁴⁾

The research adds to a growing body of evidence that challenges a long-held view in linguistics: that sounds are arbitrary*, and have no inherent* meaning. Instead, certain sounds have been found to (G) to mind consistent associations not just with shapes and sizes, but even with flavours and textures. Milk chocolate, brie cheese*, and still water tend to be perceived as

bouba / *maluma*, while crisps, bitter chocolate, mint chocolate, and sparkling water are more likely to be experienced as *kiki* / *takete*.

As widespread as the *bouba-kiki* effect is, it can be changed or cancelled out by different factors, such as our own native sound system. Suzy Styles and her PhD* student Nan Shang tested the *bouba-kiki* effect with Mandarin Chinese*. Mandarin is a tonal language*, where the meaning of a word can completely change depending on the tone* in which it is said. In English, tone can carry some meaning, for example by signalling a question, but イ does
 □ extent ハ in ニ it ホ Mandarin ヘ not ト the
チ to. The researchers presented English- and Mandarin-speakers with two Mandarin Chinese tones, one high and one falling. The English-speaking participants in the experiment perceived the high tone as spiky, and the falling one as rounded. But Mandarin speakers drew the opposite conclusion, picturing the high tone as rounded, and the falling tone as spiky.

One possible explanation is that if we are (H) with tones in a language, as English-speakers are, then we may mainly hear them as high or low, and form associations based on pitch*. But if we are (I) with tones, as Chinese speakers are, we may be able to distinguish finer nuances. In the experiment, the Mandarin speakers heard the high tone as smooth, drawn-out, and steady, and therefore, rounded. The falling tone was experienced as sudden, because it dropped quickly, making it spiky.

Other studies also found variations in the *bouba-kiki* pattern. The Himba, a remote community in Northern Namibia who speak the Otjiherero language, judged *bouba* to be round and *kiki* to be spiky, in line with the general trend. But they found milk chocolate to be spiky-tasting, suggesting that our associations with regard to our senses are not universal.

When Styles and the linguist Lauren Gawne tested the *bouba-kiki* effect on speakers of Syuba, a language in the Himalayas in Nepal, they found no consistent response either way. The Syuba speakers seemed confused by the

made-up words, possibly because they did not sound like any actual Syuba words.

(6) イ any ロ associations ハ form ニ hard ホ it ヘ made
ト meaningful チ this リ to. An analogy would be to say the made-up word “ngf” to an English speaker, and ask if it is round or spiky. It would probably be difficult to make a meaningful choice. “When we hear words that don’t follow the word-pattern of our native language, it’s often hard to do things with that word,” Styles says. “We can’t hold it in our short-term memory long enough to make decisions about it.”

Cultural factors are also likely to affect our reactions to the sound of personal names. In English, the sounds “k” and “oo” are perceived as inherently humorous. English female names are more likely to contain sounds that are perceived as small, such as the “i”-sound in Emily, and also feature more soft sounds than male names. But in other languages, names can follow a completely different sound pattern. Sidhu hasn’t yet tested the name-personality association across different languages, but expects that it would (J).

Uncovering these hidden associations holds one important real-life lesson: we probably read too much into other people’s names. After all, Sidhu and Pexman found no evidence that Bobs are actually friendlier, or Kirks more extroverted. Their findings may add weight to calls to remove names from important documents such as CVs* or scientific papers under review, to prevent unconscious bias. Sidhu supports ⁽⁷⁾the idea. “I think that makes a lot of sense,” he says. “Whenever someone is being judged, taking away all of these extra things that could bias the judgment is always a good idea.”

注 cognitive psychologist 認知心理学者
psycholinguist 心理言語学者
extroverted 外向的な
arbitrary 恣意的な
inherent 本来備わっている
brie cheese ブリーチーズ(フランス産チーズの一種)
PhD 博士課程の
Mandarin Chinese 標準中国語(Mandarin)
tonal language 声調言語
tone 声調(音の高低)
pitch 音の高さ
CV 履歴書

- 1 下線部(1)のような傾向はなぜ生じると考えられるか。m 音の場合を例にして、本文の内容に即して 50 字以内の日本語(句読点を含む)で説明しなさい。
- 2 下線部(2)の表す意味を 40 字以内の日本語(句読点を含む)で具体的に説明しなさい。
- 3 下線部(3)を that の指し示す内容を明らかにしながら和訳しなさい。
- 4 下線部(4)と同じ意味で使われている英語 1 語を本文からそのまま抜き出して解答欄に書きなさい。ただし抜き出すべき語は bias 以外とする。
- 5 下線部(5)の語を正しく並べ替えたとき、3 番目と 6 番目に来る語の記号を解答欄に書きなさい。

6 下線部(6)の語を正しく並べ替えたとき、3番目と6番目に来る語の記号を解答欄に書きなさい。

7 下線部(7) the idea の指し示す内容を、40字以内の日本語(句読点を含む)で説明しなさい。

8 外国語学習における the *bouba-kiki* effect の利点を、本文の内容に即して60字以内の日本語(句読点を含む)で説明しなさい。

9 The *bouba-kiki* effect は架空の語に関しては生じない可能性がある。その理由を本文の内容に即して60字以内の日本語(句読点を含む)で説明しなさい。

10 空欄(A), (C), (E), (F)に入れるのに最も適切な前置詞1語をそれぞれ解答欄に書きなさい。解答はすべて小文字で書いてかまわない。

11 空欄(B), (G), (J)に入れる語として最も適切なものを、下の選択肢イ～へから選び、その記号を解答欄に書きなさい。

イ account	ロ attribute	ハ bring
ニ develop	ホ originate	ヘ vary

12 空欄(D), (H), (I)に入れる語の組み合わせとして最も適切なものを、下の選択肢イ～ニから選び、その記号を解答欄に書きなさい。

(D)	(H)	(I)
イ familiar	—— familiar	—— unfamiliar
ロ familiar	—— unfamiliar	—— familiar
ハ unfamiliar	—— familiar	—— unfamiliar
ニ unfamiliar	—— unfamiliar	—— familiar

13 第3段落(Surprisingly で始まる段落)で述べられている内容を下の選択肢イ～ニから二つ選び、それらの記号を解答欄に書きなさい。

イ the *bouba-kiki* effect は、すでに顔見知りの人に対してのみ表れる。

ロ フランス語では Benoit が丸く、Eric はとがった感じに聞こえる。

ハ 丸みを感じる名前は社交的であると感じられ、きつい感じの名前は感情的な性質を思わせる。

ニ Molly や Bob といった名前は丸さ、Kirk や Kate はとがった感じをそれぞれ人々に思わせ、そうした人格を想定させる。

II Choose one of the pictures below and describe it in English. Your description should be 100 to 140 words in length. Indicate the number of the picture you have chosen. *Correctly* indicate the number of words you have written at the end of the composition.

(1)

(2)

(3)

Ⅲ 音声を聞き、その指示に従って、AおよびBの各問いに答えなさい。

A 以下は、講義の内容をまとめたメモです。空欄(1)～(6)に入れるのに最も適切な語を、講義の中から抜き出して解答欄に書きなさい。

Culture is like the (1) around us.

Proxemics: The study of the amount of (2) people feel it necessary to keep between themselves and other people.

Four different zones of proximity in middle-class Americans:

intimate zone	between zero and 18 inches	lovemaking and wrestling
personal zone	18 inches to about four feet	the (3) bubble
social zone	about four to 12 feet	business interactions
(4) zone	greater than 12 feet	actors and audience

These distances vary based on cultural (5).

- The speaker felt that the hitchhikers from France were too close to his face.
- A kind of dance ensues between people with different spatial needs.

When the (6) are violated, the performance of the team can suffer.

B 講義の内容にもとづいて、下の1～6の文の空欄に入れるのに最も適切なものを、それぞれの選択肢イ～ニから一つ選び、その記号を解答用紙に書きなさい。

1 In the mode of focused thinking, people _____.

- イ get new creative thoughts
- go back and forth to solve the problems
- ハ let their mind wander without a plan
- ニ use all their mental force

2 Diffused thinking happens when people _____.

- イ are seeing a brick wall blocking their path
- deliberately stop focusing and think freely
- ハ relax and play a game like ping-pong
- ニ try very hard to understand a problem

3 For effective learning, you should _____.

- イ practice focusing all your attention
- stay with the mode that suits you best
- ハ switch between the two modes of thinking
- ニ try to discover a new mode of thinking

4 Your phone may _____.

- イ aid in diffused thinking
- aid in focused thinking
- ハ connect your mind to what you focused on
- ニ distract you from focused thinking

(次頁に続く)

5 Salvador Dali held a large key in his hand _____.

- イ to remind himself to take a walk
- to wake himself when he dropped it
- ハ while focusing on his painting
- ニ while sitting and working in his armchair

6 The preferred order when studying for tests is to attempt _____.

- イ the easiest problem, a more difficult one, then the easiest one again
- the easiest problem, then gradually more difficult ones
- ハ the most difficult problem, an easier one, then the most difficult one again
- ニ the most difficult problem, then gradually easier ones
